**Jeremy Black : Visions of the World: A History of Maps** before purchasing it in order to gage whether or not it would be worth my time, and all praised Visions of the World: A History of Maps:

From before the age of printing to modern satellite imaging, Visions of the World tells the compelling story of the cartographers, explorers, and surveyors who have mapped our earth. Its a fresh and beautifully illustrated book, not limited to the traditional Eurocentric view but also aware of different cultures across the globe. What it reveals is fascinating, because maps not only provide a glimpse of how societies view themselves in relation to the world, they also can be tools to distort knowledge, fool enemies, or build and administer empires. View the world through ancient eyes, in the wake of Columbus, during the age of empire, and through the heyday of commerce and imperialism before

examining the revolutions in our own time.
